

# Lockout Procedures

When you need it... You need it!

## Safety first!

**A LOCKOUT PROCEDURE** is a compulsory prevention method (article 185 RSST) that enables a worker to perform a maintenance job without the risk that the equipment he is servicing can be switched on accidentally.

**Internal Maintenance** allows you to establish processes adapted to the safety requirements for your workers regarding the maintenance, repair, locking and unlocking of your machinery and/or equipment.

Create a safe environment at all times for your team...

- **Comprehensive information** as procedures include : Lockout procedure sequence, Starting and Operation testing, Unlocking procedure sequence;
- Lockout procedures, in the event of modifications are shown as "unapproved" automatically;
- **Information at the right time** since the lockout procedures are based on the equipment and are automatically printed on the work-order;
- **And much more information** since the lockout procedures also contains information about the lockout of nearby equipment for added safety.
